

Objectives

- Files
- Streams

Oct 5, 2009

Sprenkle - CS209

1

Review

- What are the two types of *exceptions*?
- What are the two ways to deal with exceptions?
- What are the benefits of exceptions?

Oct 5, 2009

Sprenkle - CS209

2

FILES

Oct 5, 2009

Sprenkle - CS209

3

java.io.File Class

- Represents a file or directory
- Provides functionality such as
 - Storage of the file on the disk
 - Determine if a particular file exists
 - When file was last modified
 - Rename file
 - Remove/delete file
 - ...

Oct 5, 2009

Sprenkle - CS209

4

Making a File Object

- Simplest constructor takes full file name (including path)
 - If don't supply path, Java assumes current directory (.)

```
File f1 = new File("chicken.data");
```

- Creates a *File object* representing a file named "chicken.data" in the current directory
- Does **not** create a file with this name on disk

Oct 5, 2009

Sprenkle - CS209

5

Files, Directories, and Useful Methods

- A *File* object can represent a file **or** a directory
 - Directories are special files in most modern operating systems
- Use *isDirectory()* and/or *isFile()* for type of file *File* object represents
- Use *exists()* method
 - Determines if a file exists on the disk

Oct 5, 2009

Sprenkle - CS209

6

More File Constructors

- String for the path, String for filename

```
File f2 = new File(
    "/home/courses/cs209/datafiles", "chicken.data");
```

- File for directory, String for filename

```
File dir= new File("/home/courses/cs209/datafiles");
File f4 = new File(dir, "chicken.data");
```

Oct 5, 2009

Sprenkle - CS209

7

"Break" any of Java's Principles?

Oct 5, 2009

Sprenkle - CS209

8

Not Portable

- Accessing the file system is inherently not portable
 - In Windows, paths are "c:\\dir"
 - In Unix, paths are "/home/courses/dir"
- Relies on underlying file system/operating system to perform actions

Oct 5, 2009

Sprenkle - CS209

9

Handling Portability Issues

- Fields in File class
 - `static separator`
 - Unix: "/"
 - Windows: "\\
 - `static pathSeparator`
 - For separating a list of paths
 - Unix: "."
 - Windows: ";"
- Use relative paths, with separators

Why two \\?

Oct 5, 2009

Sprenkle - CS209

10

java.io.File Class

- 25+ methods
 - Manipulate files and directories
 - Creating and removing directories
 - Making, renaming, and deleting files
 - Information about file (size, last modified)
 - Creating temporary files
 - ...
- See online API documentation

FileTest.java

11

STREAMS

Oct 5, 2009

Sprenkle - CS209

12

Streams

- Java handles input/output using **streams**, which are sequences of bytes

input stream: an object from which we can **read** a **sequence** of bytes
abstract class: `java.io.InputStream`

Oct 5, 2009 Sprenkle - CS209 13

Streams

- Java handles input/output using **streams**, which are sequences of bytes

output stream: an object to which we can **write** a **sequence** of bytes
abstract class: `java.io.OutputStream`

Oct 5, 2009 Sprenkle - CS209 14

Java Streams

- MANY (80+) types of Java streams
- In `java.io` package
- Why **stream** abstraction?
 - Information stored in different sources is accessed in essentially the same way
 - Example sources: file, on a web server across the network, string
 - Allows same methods to read or write data, regardless of its source
 - Create an `InputStream` or `OutputStream` of the appropriate type

Oct 5, 2009 Sprenkle - CS209 15

java.io Classes Overview

- Two types of stream classes
 - Based on datatype: Byte, Text

Oct 5, 2009 Sprenkle - CS209 16

Byte Streams

For binary data

Abstract Base Classes

Shaded: Read to/write from data sinks
 White: Does some processing

Oct 5, 2009 Sprenkle - CS209 17

Character Streams

For Text
 Handle any character in Unicode set

Abstract Base Classes

Shaded: Read to/write from data sinks
 White: Does some processing

Oct 5, 2009 Sprenkle - CS209 18

Console I/O

- Output:
 - `System.out` is a `PrintStream` object
- Input
 - `System.in` is an `InputStream` object
 - Throws exceptions if format of input data is not correct
 - Handle in `try/catch`

Oct 5, 2009

Sprenkle - CS209

19

Opening & Closing Streams

- Streams are *automatically opened* when created
- Close a stream by calling its `close()` method
 - Close a stream as soon as object is done with it
 - Free up system resources

Oct 5, 2009

Sprenkle - CS209

20

Reading & Writing Bytes

- Abstract parent class: `InputStream`
 - `abstract int read()`: reads one byte from the stream and returns it
- Concrete input stream classes override `read()` to provide appropriate functionality
 - e.g., `FileInputStream`'s `read()` reads one byte from a file
- Similarly, `OutputStream` class has abstract `write()` to write a byte to the stream

Oct 5, 2009

Sprenkle - CS209

21

Reading & Writing Bytes

- `read()` and `write()` are **blocking** operations
 - If a byte cannot be read from the stream, the method waits (does not return) until a byte is read
- `isAvailable()` allows you to check the number of bytes that are available for reading before calling `read()`

```
int bytesAvailable = System.in.isAvailable();
if (bytesAvailable > 0)
    System.in.read(byteBuffer);
```

Oct 5, 2009

Sprenkle - CS209

22

File Input and Output Streams

- `FileInputStream`: provides an input stream that can read from a file
 - Constructor takes the name of the file:

```
FileInputStream fin = new
    FileInputStream("chicken.data");
```

- Or, uses a `File` object ...

```
File inputFile = new File("chicken.data");
FileInputStream fin = new FileInputStream(inputFile);
```

Oct 5, 2009

Sprenkle - CS209

FileTest.java 23

More Powerful Stream Objects

- `DataInputStream`
 - Reads Java primitive types through methods such as `readDouble()`, `readChar()`, `readBoolean()`
- `DataOutputStream`
 - Writes Java primitive types with `writeDouble()`, `writeChar()`, ...

Oct 5, 2009

Sprenkle - CS209

24

Connected Streams

Our goal: read numbers from a file

- `FileInputStream` can read from a file but has no methods to read numeric types
- `DataInputStream` can read numeric types but has no methods to read from a file
- Java allows you to **combine** two types of streams into a **connected stream**
 - `FileInputStream` → chocolate
 - `DataInputStream` → peanut butter

Oct 5, 2009 Sprenkle - CS209 25

Connected Streams

- Think of a stream as a “pipe”
- `FileInputStream` knows how to read from a file
- `DataInputStream` knows how to read an `InputStream` into useful types
- Connect **out** end of `FileInputStream` to **in** end of `DataInputStream`...

Oct 5, 2009 Sprenkle - CS209 26

Connecting Streams

- If we want to read numbers from a file
 - `FileInputStream` reads bytes from file
 - `DataInputStream` handles numeric type reading
- Connect the `DataInputStream` to the `FileInputStream`
 - `FileInputStream` gets the bytes from the file and `DataInputStream` reads them as assembled types

```
FileInputStream fin = new
    FileInputStream("chicken.data");
DataInputStream din = new
    DataInputStream(fin); "wrap" fin in din
double num1 = din.readDouble();
```

Oct 5, 2009 Sprenkle - CS209 `DataIODemo.java` 27

Data Source vs. Filtered Streams

<p>Data Source Streams</p> <ul style="list-style-type: none"> • Communicate with a data source <ul style="list-style-type: none"> ➢ file, byte array, network socket, or URL 	<p>Filtered Streams</p> <ul style="list-style-type: none"> • Subclasses of <code>FilterInputStream</code> or <code>FilterOutputStream</code> • <i>Always</i> contains another stream • <i>Adds functionality</i> to other stream <ul style="list-style-type: none"> ➢ Automatically buffered IO ➢ Automatic compression ➢ Automatic encryption ➢ Automatic conversion between objects and bytes
--	--

Oct 5, 2009 Sprenkle - CS209 28

Buffered Streams

- Use a `BufferedInputStream` object to buffer your input streams
 - A pipe in the chain that adds buffering
 - Speeds up access

```
DataInputStream din = new DataInputStream (
    new BufferedInputStream (
        new FileInputStream("chicken.data")));
```

What functionality does each stream add?

Oct 5, 2009 Sprenkle - CS209 29

Connected Streams

Combine different types of streams to get functionality you want

- Creating a class for every class would result in even more classes and a lot of redundant code
- Similar for output
 - For buffered output to the file and to write types
 - Create a `FileOutputStream`
 - Attach a `BufferedOutputStream`
 - Attach a `DataOutputStream`
 - Perform typed writing using the methods of the `DataOutputStream` object

Oct 5, 2009 Sprenkle - CS209 30

TEXT STREAMS

Oct 5, 2009

Sprenkle - CS209

31

Text Streams

- Previous streams: operate on *binary* data, not text
- Java uses Unicode to represent characters/strings and some operating systems do not
 - Need something that converts characters from Unicode to whatever encoding the underlying operating system uses
 - Luckily, this is mostly hidden from you

Oct 5, 2009

Sprenkle - CS209

32

Text Streams

- Derived from **Reader** and **Writer** classes
 - Reader and Writer generally refer to text I/O
- Example: Make an input reader (of type **InputStreamReader**) that reads from keyboard

```
InputStreamReader in = new
    InputStreamReader(System.in);
```

- `in` reads characters from keyboard and converts them into Unicode for Java

Oct 5, 2009

Sprenkle - CS209

33

Text Streams and Encodings

- Attach an **InputStreamReader** to a **FileInputStream**

```
InputStreamReader in = new InputStreamReader(
    new FileInputStream("employee.data"));
```

- Assumes file has been encoded in the default encoding of underlying OS

- You can specify a different *encoding* in constructor of **InputStreamReader**...

```
InputStreamReader in = new InputStreamReader(
    new FileInputStream("employee.data"), "ASCII");
```

Oct 5, 2009

Sprenkle - CS209

34

Convenience Classes

- Reading and writing to text files is common
- Convenience class *combines* a **InputStreamReader** with a **FileInputStream**
 - Similar for output of text file

```
FileWriter out = new FileWriter("output.txt");
```

is equivalent to

```
OutputStreamWriter out = new OutputStreamWriter(
    new FileOutputStream("output.txt"));
```

Oct 5, 2009

Sprenkle - CS209

35

PrintWriter

- Use for writing text output
 - Easiest writer to use
- Similar to a **DataOutputStream**, **PrintStream** → has methods for printing various data types
- Methods: `print`, `printf` and `println`
 - Similar to `System.out` (a **PrintStream**) to display strings

Oct 5, 2009

Sprenkle - CS209

36

PrintWriter Example

File to write to

```
PrintWriter out = new PrintWriter("output.txt");
String myName = "Homer Simpson";
double mySalary = 35700;

out.print(myName);
out.print(" makes ");
out.print(salary);
out.println(" per year.");
or
out.println(myName + " makes " + salary +
            " per year.");
```

Oct 5, 2009

Sprenkle - CS209

37

Formatted Output

- printf or format
 - **PrintStream** new functionality since Java 1.5

```
double f1=3.14159, f2=1.45, total=9.43;
// simple formatting...
System.out.printf("%.5f and %.2f", f1, f2);
// getting fancy (%n = \n or \r\n)...
System.out.printf("%-6s%.2f%n", "Tax:", total);
```

- Can make formatted output easy
 - Before 1.5, required `java.util.Formatter` objects to generate String passed to `System.out.println()`

Oct 5, 2009

Sprenkle - CS209

38

PrintWriters and Buffering

- PrintWriters are *always* buffered
- Option: autoflush mode
 - Causes any writes to be executed directly on target destination
 - In effect, defeats the purpose of buffering
 - Constructor with second parameter set to true

```
// create an autoflushing PrintWriter
PrintWriter out = new PrintWriter("output.txt",
                                  true);
```

Oct 5, 2009

Sprenkle - CS209

39

Reading Text from a Stream

- There is no `PrintReader` class
- Use a `BufferedReader`
 - Requires a `Reader` object
- Read file, line-by-line using `readLine()`
 - Reads in a line of text and returns it as a `String`
 - Returns null when no more input is available

```
BufferedReader in = new BufferedReader(
    new FileReader("inputfile.txt"));
```

```
String line;
while ((line = in.readLine()) != null) {
    // process the line
}
Oct }
```

Oct }

40

Reading Text from a Stream

- You can also attach a `BufferedReader` to an `InputStreamReader`:

```
BufferedReader in2 = new BufferedReader(
    new InputStreamReader(System.in));
BufferedReader in3 = new BufferedReader(
    new InputStreamReader(url.openStream()));
```

- Used to be the best way to read from the console

Oct 5, 2009

Sprenkle - CS209

41

java.util.Scanner

- New class for handling input
 - Since Java 1.5
- Many constructors
 - Read from file, input stream, string ...

```
Scanner sc = new Scanner(System.in);
```

- Many methods
 - `readNextXXXX` (int, long, line)
 - Skipping patterns, matching patterns, etc.

Oct 5, 2009

Sprenkle - CS209

42

Using Scanners

- Use `nextXXX()` to read from it...

```
long tempLong;

// create the scanner for the console
Scanner sc = new Scanner(System.in);

// read in an integer and a string
int i = sc.nextInt();
String restOfLine = sc.nextLine();

// read in a bunch of long integers
while (sc.hasNextLong()) {
    tempLong = sc.nextLong();
}
```

Oct 5, 2009

Sprenkle - CS209

43

Using Scanner

```
public static void main(String[] args) {

    // open the Scanner on the console input, System.in
    Scanner scan = new Scanner(System.in);

    System.out.print("Please enter the width of a rectangle: ");
    int width = scan.nextInt();

    System.out.print("Please enter the height of a rectangle: ");
    int length = scan.nextInt();

    System.out
        .println("The area of your square is " + length * width +
            ".");
}
```

ConsoleIODEmo.java

Oct 5, 2009

Sprenkle - CS209

44

Scanners

- Breaks its input into tokens using a delimiter pattern, which matches whitespace
 - What is "delimiter pattern"?
 - What is "whitespace"?
- Converts resulting tokens into values of different types using `nextXXX()`
- Can change token delimiter from default of whitespace
- Assumes numbers are input as decimal
 - Can specify a different radix
- Scanners are for Java 1.5 and up only

Oct 5, 2009

Sprenkle - CS209

45

Scanners & Exceptions

- Do not throw `IOExceptions`!
 - For a simple console program, `main()` does not have to deal with or throw `IOExceptions`
 - Required with `BufferedReader/InputStreamReader` combination
- Throws `InputMismatchException` when token doesn't match pattern for expected type
 - e.g., `nextLong()` called with next token "AAA"
 - `RuntimeException` (no catching required)

Oct 5, 2009

Sprenkle - CS209

46

Assignment 7

- Modifying Olympic Score generator
 - Read difficulty score from console
 - Read execution scores from a file
 - Filename comes from console or command-line arguments

Oct 5, 2009

Sprenkle - CS209

47
