

## Objectives

- Data structure: Heaps
- Data structure: Graphs

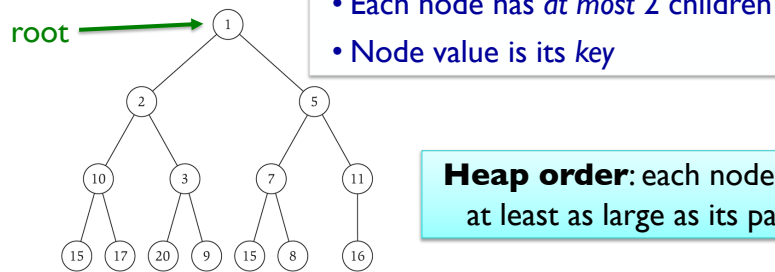

Submit problem set 2

## Review

- What is a priority queue?
- What is a heap?
  - Properties
  - Implementation
- What is the process for finding the smallest element in a heap?
- What is the process for adding to a heap?
  - What is the runtime of adding to a heap?

## Review: Heap Defined

- Combines benefits of sorted array and list
- Balanced binary tree

**Heap order:** each node's key is at least as large as its parent's

Note: **not** a binary search tree

CSCI211 - Spenkle

3

## Review: Implementing a Heap

- Option 1: Use pointers
  - Each node keeps
    - Element it stores (key)
    - 3 pointers: 2 children, parent
- Option 2: No pointers
  - Requires knowing upper bound on  $n$
  - For node at position  $i$ 
    - left child is at  $2i$
    - right child is at  $2i+1$

4

## Review: Implementing a Heap

- Finding the minimal element
  - First element
  - $O(1)$

Jan 25, 2019

CSCI211 - Srenkle

5

## Review: Heapi fy-Up

Heap      Position where node added

```

Heapify-up(H, i):
  if i > 1 then
    j=parent(i)=floor(i/2)
    if key[H[i]] < key[H[j]] then
      swap array entries H[i] and H[j]
      Heapify-up(H, j)
  
```

Jan 25, 2019

CSCI211 - Srenkle

6

## Heapify-Up

- **Claim.** Assuming array  $H$  is almost a heap with key of  $H[i]$  too small, **Heapify-Up** fixes the heap property in  $O(\log i)$  time
  - Can insert a new element in a heap of  $n$  elements in  $O(\log n)$  time
- **Proof.** By induction
  - If  $i=1$  ...

8

## Heapify-Up

- **Claim.** Assuming array  $H$  is almost a heap with key of  $H[i]$  too small, **Heapify-Up** fixes the heap property in  $O(\log i)$  time
  - Can insert a new element in a heap of  $n$  elements in  $O(\log n)$  time
- **Proof.** By induction
  - If  $i=1$ , is already a heap  $\rightarrow O(1)$
  - If  $i>1$ ,
    - Swaps are  $O(1)$
    - Swaps continue up to root (max)  $\rightarrow \log i$

## Deleting an Element

Jan 25, 2019

CSCI211 - Srenkle

10

## Deleting an Element

- Delete at position  $i$
- Removing an element:
  - Messes up heap order
  - Leaves a “hole” in the heap
- Not as straightforward as **Heapify-Up**
- Algorithm:
  1. Fill in element where hole was
    - Patch hole: move  $n^{\text{th}}$  element into  $i^{\text{th}}$  spot
  2. Adjust heap to be in order
    - At position  $i$  because moved  $n^{\text{th}}$  item up to  $i$

Jan 25, 2019

CSCI211 - Sprenkle

11

## Deleting an Element

Example of OK:  
11 deleted, replaced by 16

- Two “bad” possibilities: element  $w$  is
  - Too small: violation is between it and parent → **Heapify-Up**
  - Too big: with one or both children → **Heapify-Down** (example:  $w$  becomes 12)

Jan 25, 2019

CSCI211 - Sprenkle

12

## Deleting an Element

Example where new key is too small

- Delete 9
- Replace with 5 (from other side of heap)
- But  $5 < 6$ , so need to **Heapify-Up**

Jan 25, 2019

CSCI211 - Sprenkle

13

## Heapify-Down

```

Heapify-down(H, i):
  n = length(H)
  if 2i > n then           Why can we stop?
    Terminate with H unchanged
  else if 2i < n then
    left=2i and right=2i+1
    j be index that minimizes
      key[H[left]] and key[H[right]]
  else if 2i = n then
    j=2i

  if key[H[j]] < key[H[i]] then
    swap array entries H[i] and H[j]
    Heapify-down(H, j)
  
```

Jan 25, 2019

CSCI211 - Sprenkle

14

## Heapify-Down

```

Heapify-down(H, i):
  n = length(H)
  if 2i > n then           i is a leaf – nowhere to go
    Terminate with H unchanged
  else if 2i < n then
    left=2i and right=2i+1
    j be index that minimizes
      key[H[left]] and key[H[right]]
  else if 2i = n then
    j=2i

  if key[H[j]] < key[H[i]] then
    swap array entries H[i] and H[j]
    Heapify-down(H, j)
  
```

18

## Runtime of Heapify-Down?

```

Heapify-down(H, i):
  n = length(H)
  if 2i > n then
    Terminate with H unchanged
  else if 2i < n then
    left=2i and right=2i+1
    j be index that minimizes  $O(1)$ 
      key[H[left]] and key[H[right]]
  else if 2i = n then
    j=2i

  if key[H[j]] < key[H[i]] then
    swap array entries H[i] and H[j]  $O(1)$ 
    Heapify-down(H, j)
  
```

Num swaps:  $O(\log n)$

## Implementing Priority Queues with Heaps

Operation	Description	Run Time
StartHeap(N)	Creates an empty heap that can hold N elements	
Insert(v)	Inserts item v into heap	
FindMin()	Identifies minimum element in heap but does not remove it	
Delete(i)	Deletes element in heap at position i	
ExtractMin()	Identifies and deletes an element with minimum key from heap	

Jan 25, 2019

CSCI211 - Sprenkle

20

## Implementing Priority Queues with Heaps

Operation	Description	Run Time
StartHeap(N)	Creates an empty heap that can hold N elements	$O(N)$
Insert(v)	Inserts item v into heap	$O(\log n)$
FindMin()	Identifies minimum element in heap but does not remove it	$O(1)$
Delete(i)	Deletes element in heap at position i	$O(\log n)$
ExtractMin()	Identifies and deletes an element with minimum key from heap	$O(\log n)$

Jan 25, 2019

CSCI211 - Sprenkle

21

## Comparing Data Structures

Operation	Heap	Unsorted List	Sorted List
Start(N)		$O(1)$	$O(1)$
Insert(v)		$O(1)$	$O(n)$
FindMin()		$O(1)$	$O(1)$
Delete(i)		$O(n)$	$O(1)$
ExtractMin()		$O(n)$	$O(1)$

23

## Putting It All Together...

1. Add elements into PQ with the number's value as its priority
2. Then extract the smallest number until done
  - Come out in sorted order

What is the running time of sorting numbers using a PQ implemented with a **heap**?

$O(n \log n)$

Jan 25, 2019

CSCI211 - Sprenkle

24

## Additional Heap Operations

- Access elements in PQ by “name”

Key	2	4	5	6	9	20	← Priority
Value	3542	5143	8712	1264	9123	5954	← Process id

- Maintain additional array **Position** that stores current position of each element in heap

- Operations:

- **Delete(Position[v])**
  - Does not increase overall running time
- **ChangeKey(v,  $\alpha$ )**
  - Changes key of element v to  $\alpha$
  - Identify position of element v in array (**Position** array)
  - Change key, heapify

## GRAPHS

Jan 25, 2019

CSCI211 - Srenkle

26

## Undirected Graphs $G = (V, E)$

- $V$  = nodes (vertices)
- $E$  = edges between pairs of nodes
- Captures pairwise relationship between objects
- Graph size parameters:  $n = |V|$ ,  $m = |E|$

$V = \{ 1, 2, 3, 4, 5, 6, 7, 8 \}$   
 $E = \{ 1-2, 1-3, 2-3, 2-4, 2-5, 3-5, 3-7, 3-8, 4-5, 5-6 \}$   
 $n = 8$   
 $m = 11$

CSCI211 - Sprenkle

35

## Graph Representation: Adjacency List

- Node indexed array of lists
  - Two representations of each edge
  - Space? ← What are the extremes?
  - Checking if (u, v) is an edge?
  - Identifying all edges?

Jan 25, 2019

CSCI211 - Sprenkle

36

## Graph Representation: Adjacency List

- Node indexed array of lists
    - Two representations of each edge
    - Space =  $2m + n = O(m + n)$
    - Checking if (u, v) is an edge takes  $O(\text{deg}(u))$  time
    - Identifying all edges takes  $\Theta(m + n)$  time
- degree = number of neighbors of u  
↓

CSCI211 - Sprenkle

37

## Paths and Connectivity

- Def. A **path** in an undirected graph  $G = (V, E)$  is a sequence  $P$  of nodes  $v_1, v_2, \dots, v_{k-1}, v_k$ 
  - Each consecutive pair  $v_i, v_{i+1}$  is joined by an edge in  $E$
- Def. A path is **simple** if all nodes are *distinct*
- Def. An undirected graph is **connected** if  $\forall$  pair of nodes  $u$  and  $v$ , there is a path between  $u$  and  $v$

- Short path
- Distance
