

## Objectives

- Directed Graphs
  - Topological ordering
  - Strong Connectivity
- Greedy Algorithms
  - Interval Scheduling

## Review

- What is a topological ordering?
  - What does the graph represent?
    - What are the constraints on the graph?
  - What is the output?
  - How do we find the topological ordering?
    - How would we implement?
    - What is its runtime?

## Topological Order Runtime

```

Find a node  $v$  with no incoming edges
Order  $v$  first
Delete  $v$  from  $G$ 
Recursively compute a topological ordering of  $G-\{v\}$ 
and append this order after  $v$ 

```

- Where are the costs?
- How would we implement?

Feb 6, 2019

CSCI211 - Sprenkle

3

## Topological Order Runtime

```

Find a node  $v$  with no incoming edges  $O(n)$ 
Order  $v$  first  $O(1)$ 
Delete  $v$  from  $G$   $O(n)$ 
Recursively compute a topological ordering of  $G-\{v\}$   $O(n)$ 
and append this order after  $v$   $O(1)$ 

```

- Find a node without incoming edges and delete it:  $O(n)$
  - Repeat on all nodes
- $O(n^2)$

Can we do better?

Feb 6, 2019

CSCI211 - Sprenkle

4

## Topological Sorting Algorithm: Running Time

- **Theorem.** Find a topological order in  $O(m + n)$  time
- **Pf.**
  - **Maintain the following information:**
    - $\text{count}[w]$  = remaining number of incoming edges
    - $S$  = set of remaining nodes with no incoming edges
  - **Initialization:**  $O(m + n)$  via single scan through graph
  - **Algorithm:**
    - Select a node  $v$  from  $S$ , remove  $v$  from  $S$
    - Decrement  $\text{count}[w]$  for all edges from  $v$  to  $w$ 
      - Add  $w$  to  $S$  if  $\text{count}[w] = 0$

Directed Graphs

## **STRONG CONNECTIVITY**

Feb 6, 2019

CSCI211 - Sprenkle

6

## Strong Connectivity

- Def. Node  $u$  and  $v$  are **mutually reachable** if there is a **path** from  $u \rightarrow v$  and also a **path** from  $v \rightarrow u$  (not necessarily a direct edge)
- Def. A graph is **strongly connected** if every pair of nodes is mutually reachable
- Lemma. Let  $s$  be any node.  $G$  is strongly connected **iff** every node is reachable from  $s$  and  $s$  is reachable from every node

➤ We want to prove this...

Feb 6, 2019

CSCI211 - Sprenkle

7

## Strong Connectivity

- If  $u$  and  $v$  are mutually reachable and  $v$  and  $w$  are mutually reachable, then  $u$  and  $w$  are mutually reachable

What do we need to show to prove this is true?

Feb 6, 2019

CSCI211 - Sprenkle

8

## Strong Connectivity

- If  $u$  and  $v$  are mutually reachable and  $v$  and  $w$  are mutually reachable, then  $u$  and  $w$  are mutually reachable.
- **Proof.** We need to show that there is a path from  $u \rightarrow w$  and from  $w \rightarrow u$ .
  - By defn of mutually reachable
    - There is a path  $u \rightarrow v$  & a path  $v \rightarrow u$
    - There is a path  $v \rightarrow w$ , and a path  $w \rightarrow v$
  - Take path  $u \rightarrow v$  and then from  $v \rightarrow w$ 
    - Path from  $u \rightarrow w$
  - Similarly for  $w \rightarrow u$

Feb 6, 2019

CSCI211 - Sprenkle

9

## Strong Connectivity

- **Def.** A graph is **strongly connected** if every pair of nodes is mutually reachable
- **Lemma.** Let  $s$  be any node in  $G$ .  $G$  is **strongly connected** iff every node is reachable from  $s$ , and  $s$  is reachable from every node.
  - 1<sup>st</sup> prove  $\Rightarrow$
  - 2<sup>nd</sup> prove  $\Leftarrow$ 
    - for any nodes  $u$  and  $v$ , is there a path  $u \rightarrow v$  and  $v \rightarrow u$ ?

Feb 6, 2019

CSCI211 - Sprenkle

10

## Strong Connectivity

- **Def.** A graph is **strongly connected** if every pair of nodes is mutually reachable
- **Lemma.** Let  $s$  be any node in  $G$ .  
 $G$  is **strongly connected** iff every node is reachable from  $s$ , and  $s$  is reachable from every node.
  - Pf.  $\Rightarrow$  Follows from definition of strongly connected
  - Pf.  $\Leftarrow$  For any nodes  $u$  and  $v$ , make path  $u \rightarrow v$  and  $v \rightarrow u$ 
    - $u \rightarrow v$ : concatenating  $u \rightarrow s$  with  $s \rightarrow v$
    - $v \rightarrow u$ : concatenate  $v \rightarrow s$  with  $s \rightarrow u$

11

## Strong Connectivity Problem

- **Claim:** We can determine if  $G$  is strongly connected in  $O(m + n)$  time

strongly connected

not strongly connected

Hint: Can we leverage any algorithms we know have  $O(m+n)$  time?

Feb 6, 2019

CSCI211 - Sprenkle

12

## Strong Connectivity: Algorithm

- Theorem. Can determine if  $G$  is strongly connected in  $O(m + n)$  time.
- Pf.
  - Pick any node  $s$
  - Run BFS from  $s$  in  $G$
  - Run BFS from  $s$  in  $G_{\text{rev}}$  reverse orientation of every edge in  $G$   
Or, the BFS using the *in* edges
  - Return true *iff* **both** BFS executions reach **all** nodes
  - Correctness follows immediately from previous lemma
    - All reachable from one node,  $s$  is reached by all

Feb 6, 2019

CSCI211 - Sprenkle

13

## Strong Components

- Strong components: analogous to connected component in undirected graph
  - Set of mutually reachable nodes
- For any two nodes  $s$  and  $t$  in a directed graph, their strong components are either identical or disjoint

Hint: Consider a node in common...

Feb 6, 2019

CSCI211 - Sprenkle

14

## Strong Components

- For any two nodes  $s$  and  $t$  in a directed graph, their strong components are either identical or disjoint
- Proof.
  - Consider  $v$  in both strong components
    - $s \rightarrow v; v \rightarrow s; v \rightarrow t; t \rightarrow v \rightarrow$   
 $t \rightarrow s, s \rightarrow t$  (mutually reachable)
    - As soon as there is one common node, then have identical strong components
  - On the other hand, consider  $s$  and  $t$  are not mutually reachable
    - No node  $v$  that is in the strong component of each
      - What would it mean if there were?

Feb 6, 2019

CSCI211 - Sprenkle

15

## GREEDY ALGORITHMS

Feb 6, 2019

CSCI211 - Sprenkle

16

## Greedy Algorithms

At each step, take as much as you can get  
→ “local” optimizations

- Need a proof to show that the algorithm finds an optimal solution
- A counter example shows that a greedy algorithm does not provide an optimal solution

Feb 6, 2019

CSCI211 - Srenkle

17

## Example of Greedy Algorithm

- How do you make change to give out the *fewest* coins?
- Determine for 34¢

Feb 6, 2019

CSCI211 - Srenkle

18

## Example of Greedy Algorithm

- How do you make change to give out the *fewest* coins?

```
while change > 0:
    if change >= 25:
        print "Quarter"
        change -= 25
    elif change >= 10:
        print "Dime"
        change -= 10
    ...
```

Let's generalize ...

- Ex: 34¢.

Feb 6, 2019

CSCI211 - Sprenkle

19

## Coin Changing

- Goal.** Given currency denominations: 1, 5, 10, 25, 100, devise a method to pay amount to customer using fewest number of coins.

- Ex: 34¢.

- Cashier's algorithm.** At each iteration, add coin of the largest value that does not take us past the amount to be paid.

- Ex: \$2.89.

Feb 6, 2019

CSCI211 - Sprenkle

20

## Greedy Algorithm Template

- Consider candidates (or whatever) in some order
  - Decision: What order is best?
- Take each candidate provided it's compatible with the ones already taken

What are options for orders?

What is our goal?  
What are we trying to minimize/maximize?

What is the worst case?

## Greedy Algorithm Pseudo-Code

In some specified order

```

Set Greedy (List candidates){
  solution = new Set( );
  while candidates.isNotEmpty()
    next = candidates.select() //use selection criteria,
    //remove from candidate and return value
    if solution.isFeasible(next) //constraints satisfied
      solution.union(next)
    if solution.solves()
      return solution

  //No more candidates and no solution
  return null
}
  
```

## Coin-Changing: Greedy Algorithm

- **Cashier's algorithm.** At each iteration, add coin of the largest value that does not take us past the amount to be paid.

Sort coins' denominations by value:  $c_1 < c_2 < \dots < c_n$ .

```

S ← ∅
while x ≠ 0
  let k be largest integer such that  $c_k \leq x$ 
  if k = 0
    return "no solution found" ← How could this happen?
  x = x -  $c_k$ 
  S = S ∪ {k}
return S

```

Is cashier's algorithm **optimal**?

Feb 6, 2019

CSCI211 - Sprenkle

23

## Coin-Changing: Analysis of Greedy Algorithm

- **Observation.** Greedy algorithm is sub-optimal for US postal denominations:
  - 500 300 200 100 86 85 79 78 66 65 46 44 33 32 20 4 3 2 1
- **Counterexample.** 158¢.
  - Greedy: 100, 44, 4, 4, 4, 2.
  - Optimal: 79, 79.

## Proving Greedy Algorithms Work

- Specifically, produce an **optimal** solution
- Approaches:
  - Greedy algorithm stays ahead
    - Does better than any other algorithm at each step
  - Exchange argument
    - Transform any solution into a greedy solution
  - Structural argument
    - Figure out some structural bound that all solutions must meet

Feb 6, 2019

CSCI211 - Srenkle

26

Greedy algorithm stays ahead

## INTERVAL SCHEDULING

Feb 6, 2019

CSCI211 - Srenkle

27

## Interval Scheduling

- Job  $j$  starts at  $s_j$  and finishes at  $f_j$
- Two jobs are **compatible** if they don't overlap
- **Goal**: find maximum subset of mutually compatible jobs

- Every job is worth equal money.
- To earn the most money → schedule the most jobs

Feb 6, 2019

CSCI211 - Sprenkle

28

## Greedy Algorithm Template

- Consider candidates (in this case, jobs) in some order
- Take each job provided it's compatible with the ones already taken

What are options for orders?

Let's take as an example the current order

What is our goal?  
What are we trying to optimize?

What is the worst case?  
(Helps us with finding counterexamples to optimality.)
